

Truss Jibs

Truss Jib - A truss jib is utilized to be able to lift and place trusses. It is actually an extended jib additional part which is outfitted with a triangular or pyramid shaped frame. Usually, truss jibs are mounted on equipment such as a compact telehandler, a skid steer loader or even a forklift making use of a quick-coupler accessory.

Older kind cranes that have deep triangular truss jibs are usually assemble and fastened with bolts and rivets into standard open structural shapes. There are hardly ever any welds on these style jibs. Every riveted or bolted joint is susceptible to corrosion and thus needs regular maintenance and inspection.

Truss jibs are made with a back-to-back collection of lacing members separated by the width of the flange thickness of another structural member. This particular design causes narrow separation between the flat exteriors of the lacings. There is limited access and little room to preserve and clean them against rusting. A lot of rivets loosen and corrode inside their bores and must be changed.
