

Used Parts for Forklifts

Used Forklift Parts - Over time, lift truck components will wear and need to be replaced. Obtaining new components can become a costly endeavor so another idea is to acquire used forklift parts. This can save much cash in the end. It is a great idea to buy used forklift parts which have been remanufactured. These components would ensure that you are getting components which will work for a long time and be productive.

Worn or broken parts that are reproduced are a cheaper answer than rebuilding. With rebuilding parts, just the components which are broken or worn out get changed, which means that other wearable components may break down soon after purchase.

Remanufacturing on the other hand offers the best guarantee for second-hand parts. Reproduced parts are taken apart and cleaned and then all wearable pieces are replaced. All wearable parts are replaced regardless of age or wear which is another rationale why reproduced components overall perform so much better. Any component within the part is new and this offers much longer life to the used part. Based on the forklift parts that are being redone, the cleaning process and the whole remanufacturing process will differ.

The engines are cleaned after a complete disassembly. Several engine parts like for instance rings, pistons, spark plugs, valves, valve springs, and filters can be replaced during the process of remanufacturing. The engines are hot tested after reassembly to ensure that there are no leaks, no noises, no oil pressure problems or any vacuum.

Transmissions are disassembled, oven cleaned and pressure washed. A complete inspection is performed so as to check for any cracks. Bushings, seals and bearings are all replaced. Normally, the replacement components used on transmission components meet OEM specifications.

Certain components such as the water pump, torque converters, the alternator, the starter and steer axles can obtain longer serviceability after being remanufactured and having all wearable parts replaced. The electronic control in the electric lift truck is maintained by the control card. This card could even be remanufactured with replacing all aged and worn out components. Unlike other forklift components the control card can only have the worn and aged components replaced.

Components which are reproduced have to be thoroughly checked upon reassembly to guarantee they are in good condition previous to being sold. When obtaining these parts, it is a good idea to make sure that they have undergone all of the proper testing and inspections. On certain bigger parts like transmissions, steer axles and engines, OEM specification replacement components should be used.

The dealer of used lift trucks and components could guarantee that the reproduced parts have met OEM specifications and that these parts meet industry standards. Lots of details go into remanufacturing used components. This attention to detail provides more serviceability out of remanufactured parts opposed to the components that were merely rebuilt.
